EUROPEAN MARKET MONITOR
CARS AND VANS: JANUARY–DECEMBER 2025

PASSENGER CAR REGISTRATIONS

Approximately 11 million new cars were registered in Europe in 2025, about 2% more than the previous year.[1] The average share of battery electric vehicles (BEVs) among total new registrations in Europe reached a historic high of 25% in December 2025, up from 23% in November. The Mercedes-Volvo-Polestar-Smart and Nissan-BYD pools led in BEV registration shares in December, each with 34%, followed closely by the BMW (33%), Kia (29%), and Tesla and Volkswagen pools (each with 25%). Below the European average were the Renault (19%) and Hyundai (15%) pools, followed by SAIC (13%).

This brought the BEV share of total new registrations for 2025 to 19%, an increase of 4 percentage points compared with 2024. Several manufacturer pools had substantial increases in BEV shares in 2025 versus the previous year. Kia recorded a 10 percentage-point increase, followed by the Nissan-BYD, Volkswagen, and Hyundai pools (+7 percentage points each). By contrast, SAIC saw a drop in its BEV share from 31% in 2024 to 14% in 2025. Plug-in hybrid electric vehicles (PHEVs) had an average market share of 9% among new registrations in Europe in 2025 (up 2 percentage points over the previous year), led by the Mercedes-Volvo-Polestar-Smart pool with a 24% share. For full hybrid electric vehicles (HEVs), SAIC (46%), the Renault pool (29%), and the Nissan-BYD pool (24%) recorded the largest shares in 2025. In the mild hybrid electric (MHEV) segment, the BMW and Mercedes-Volvo-Polestar-Smart pools led in registration shares in 2025, at 37% and 36%, respectively. Conventional internal combustion engine vehicles (ICEVs) comprised 31% of new registrations in December and 37% in 2025. This is 10 percentage points lower than in 2024.

1 New registration data for December 2025 are currently unavailable for Bulgaria, Cyprus, and Portugal. Based on observed trends from 2024, the reported total number of new registrations for 2025 is expected to increase by approximately 0.2% once data for these markets become available.

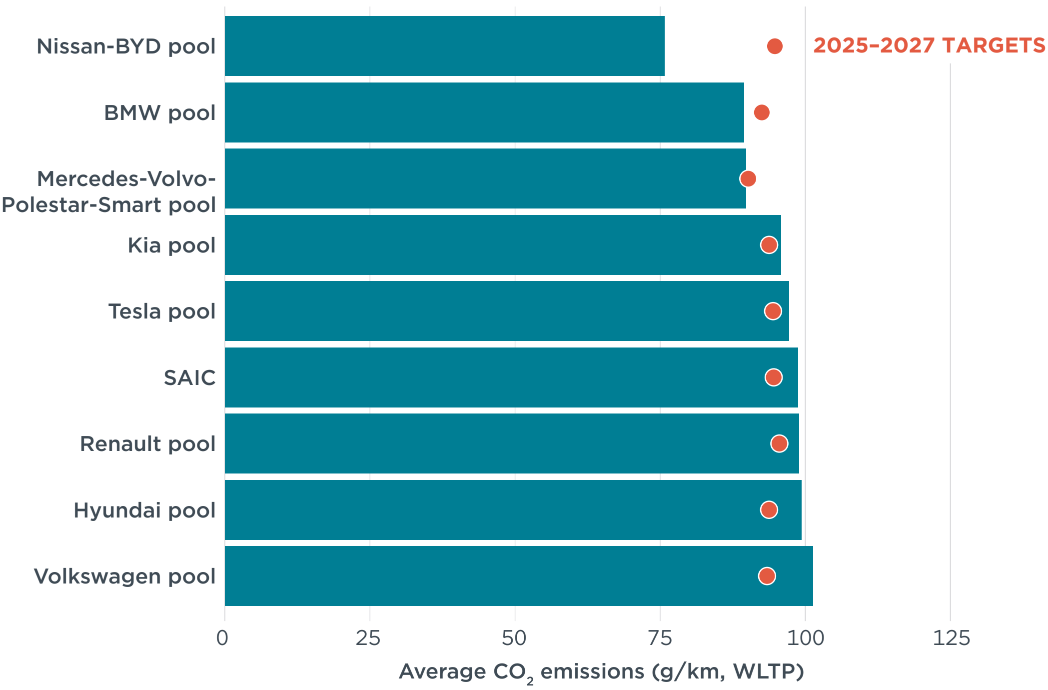
Figure 2

Average CO_2 emissions of manufacturer pools and individual manufacturers compared with estimated 2025–2027 targets, 2025



Note: Emission values include compliance credits. All CO_2 values are estimates according to the Worldwide harmonized Light vehicles Test Procedure (WLTP). Only manufacturer pools and individual manufacturers with at least 1% market share in 2025 are shown. See the section on definitions, data sources, methodology, and assumptions for more information.

THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION **THEICCT.ORG**

For the second month in a row, average monthly manufacturer carbon dioxide (CO_2) emissions fell below the target for the 2025–2027 period, dropping to 87 g CO_2/km in December. That brought the average CO_2 emissions among manufacturer pools to 98 g CO_2/km in 2025. Including compliance credits, manufacturing pools thus remained 4 g CO_2/km short of the average target of 93 g CO_2/km for the 2025–2027 period. Compared with the previous month, CO_2 emissions dropped 7 g CO_2/km for the Mercedes-Volvo-Polestar-Smart pool, 4 g CO_2/km for the Tesla and Volkswagen pools, and 3 g CO_2/km for the Kia pool, while CO_2 emissions for the SAIC and Hyundai pools increased by 4 and 8 g CO_2/km, respectively, in December. Nearly all manufacturer pools reduced their target gap by 1 g CO_2/km or more, except for Hyundai, whose target gap increased by 1 g CO_2/km. The Nissan-BYD had the largest margin below its 2025–2027 target (19 g CO_2/km), followed by the BMW pool (3 g CO_2/km below), while the Mercedes-Volvo-Polestar-Smart pool exactly met its target. The Volkswagen pool remained the furthest behind, exceeding its target by 8 g CO_2/km, down from 9 g CO_2/km in November.

Looking at individual car brands with market shares of 1% or greater, Tesla and BYD had the greatest over-compliance at 91 g CO_2/km and 81 g CO_2/km, respectively, below their projected brand-level average targets for 2025–2027, followed by Volvo (31 g CO_2/km below), Mini (19 g CO_2/km below) and Cupra (17 g CO_2/km below). The brands with the largest target gaps were Nissan (29 g CO_2/km above), SEAT (25 g CO_2/km above), Mazda (20 g CO_2/km above), Mercedes (19 g CO_2/km above), and Fiat (18 g CO_2/km above). Audi and Ford reduced their target gaps by an additional 3 g CO_2/km compared with the previous month.

Table 1

Share of battery electric, plug-in hybrid, full hybrid, and mild hybrid passenger cars by manufacturer pool or manufacturer

Manufacturer or manufacturer pool	Dec 2025				2025				2024

Suzuki	112	115	1.5	113	99	1	99	15	1%
Nissan	121	123	0.9	122	93	1	93	29	2%
Nissan	121	123	0.9	122	93	1	93	29	2%

Note: Brand shares may not add up to manufacturer group totals, because only brands with at least 1% market share in 2025 are displayed in the table. Manufacturers are sorted by ascending fleet-average CO_2 emissions. See the section on definitions, data sources, methodology, and assumptions for details.

* The CO_2 targets in the table are hypothetical only, as official targets are set at the manufacturer or manufacturer-pool level, not at the brand level.

PASSENGER CAR REGISTRATIONS BY COUNTRY

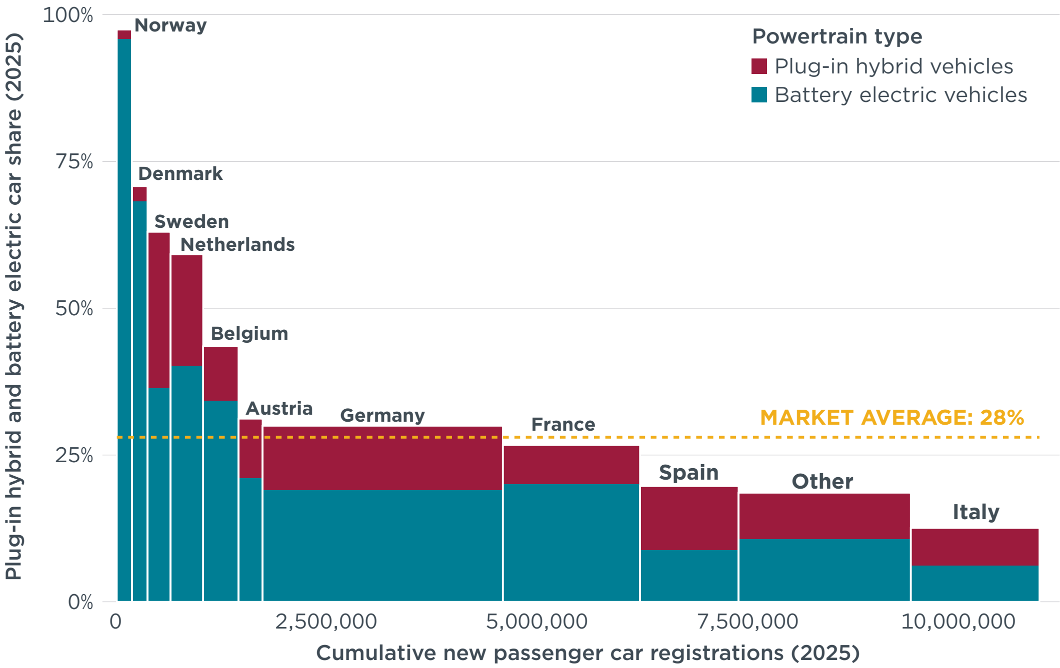
Compared with 2024, total passenger car registrations among the major European markets grew the most in Spain (+13%) and Austria (+12%) in 2025, while registrations declined the most in Belgium (−7%) and France (−5%). In terms of the largest markets by combined new BEV and PHEV registrations, Norway (97%), Denmark (71%), Sweden (63%), and the Netherlands (59%) all had shares above 50%. Belgium (44%), Austria (31%), and Germany (30%) also recorded combined BEV and PHEV market shares above the European average of 28%. Among the largest markets by total new passenger car registrations, BEV registration shares increased the most in Belgium (+6 percentage points), Germany, and the Netherlands (+5 percentage points each) in 2025. For Germany—the largest European passenger car market by new registrations—this represents a 43% increase compared with the previous year, with nearly 55,000 cars registered in December alone.

BEV registrations in 2025 grew strongly in Poland (+163%), Spain (+77%), and Italy (+46%) compared with the previous year. The introduction of government incentives promoted this growth: Spain reactivated its MOVES III program—first introduced in 2021—after it expired at the end of 2024 and Poland rolled out the NaszEauto program in February 2025. The effects of Italy's new electric vehicle incentives, launched at the end of October, are already evident, with BEV registrations in November and December exceeding 12,000 units, more than double the monthly average for the rest of the year.

Compared with 2024, registration shares of PHEVs increased the most in the Netherlands and Spain (+5 percentage points) in 2025, while shares decreased by 6 percentage points in Belgium, where BEV demand is strong. Looking at the HEV market, shares of new registrations remained the highest in France and Poland (22% each) in 2025, while shares of MHEVs were highest in Italy (31%) and Poland (26%). MHEVs gained popularity in France, where they made up 21% of new registrations, representing a 37% increase compared with 2024.

Figure 3

Share of plug-in hybrid and battery electric passenger cars by country



Note: The figure highlights the 10 largest markets by new BEV and PHEV registrations. The "Other" category includes all remaining countries of the European Economic Area (EEA) except for Bulgaria, Liechtenstein, and Malta. Data for Cyprus and Portugal, both categorized under "Other," cover January to November 2025 only.

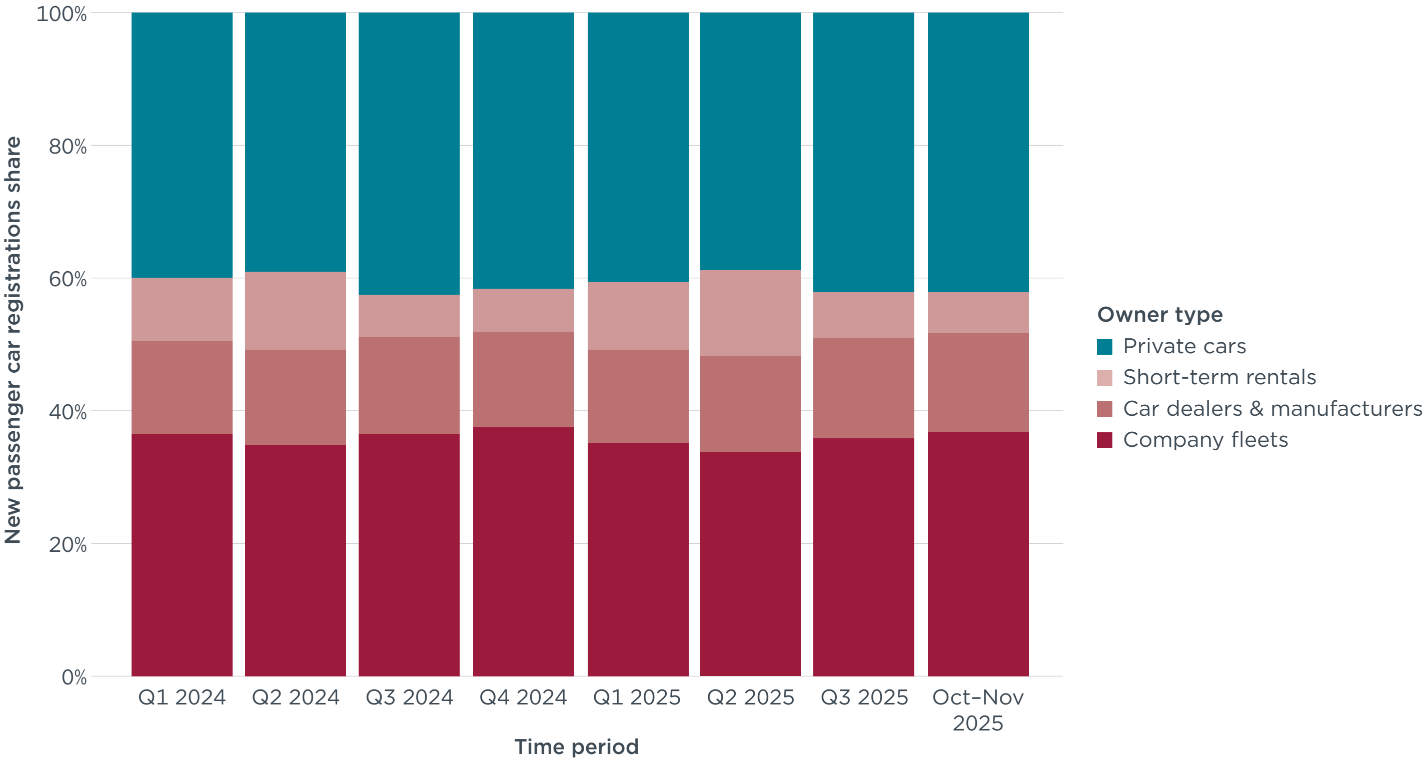
PASSENGER CAR REGISTRATIONS BY OWNER

Company fleets (37%), car dealers and manufacturers (15%), and short-term rentals (6%)—which are collectively referred to as corporate fleets—made up 58% of the total new registrations in October and November 2025, while private cars made up 42% of the market. This distribution mirrors that of the fourth quarter of 2024.

Figure 4

New passenger car registrations by owner for 19 selected European countries



Note: Selected countries are listed in the "Definitions, data sources, methodology, and assumptions" section.

THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION **THEICCT.ORG**

VAN REGISTRATIONS

Approximately 1.4 million new vans were registered in Europe in 2025, down from 1.6 million in 2024.[2] Compared with 2024, registrations declined in France (−6%), Germany (−5%), and Italy (−5%) in 2025, while registrations in Spain grew by 9%. In 2025, 9% of newly registered vans were battery electric in Germany and France, compared with 5% in Germany and 7% in France in the previous year; in Q4 2025, shares reached 11% in Germany and 10% in France. European BEV registrations reached 12% in Q4 2025, resulting in an annual average share of 10% in 2025. The Toyota pool (17%), Volkswagen pool and Nissan (both 12%), and the Mercedes-Benz and Renault pools (both 11%) all had BEV shares above the 2025 European average, while the Stellantis (8%) and Ford (7%) pools as well as Iveco (1%) were below the average. The Toyota pool saw the greatest increase in BEV shares in 2025, at 10 percentage points over 2024, followed by the Renault pool (+7 percentage points). Looking at fleet-average CO_2 emissions, the average target gap is estimated to be 20 g CO_2/km, down from 22 g CO_2/km after the third quarter. The Toyota and Ford pools notably reduced their target gaps by 6 g CO_2/

2 New registration data for December 2025 are currently unavailable for Bulgaria, Cyprus, Portugal, and Sweden. Based on observed trends from 2024, the reported total number of new registrations for 2025 is expected to increase by approximately 0.5% once data for these markets becomes available.

km each in the fourth quarter of 2025, while Iveco was the farthest from its 2025 CO_2 target with a gap of 34 g CO_2/km.

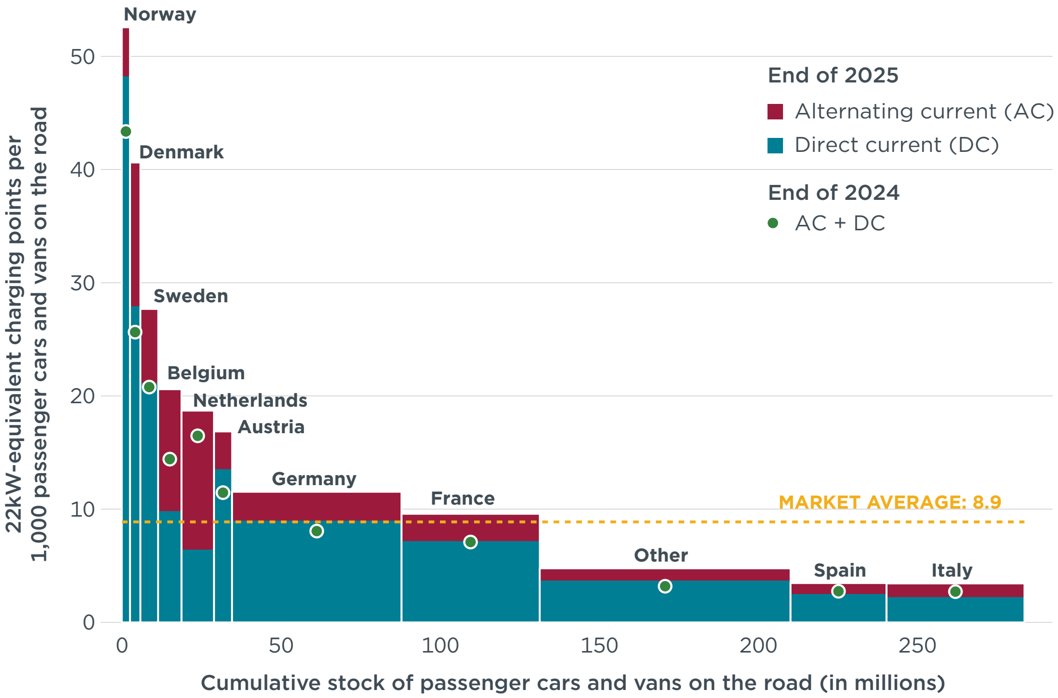
CHARGING INFRASTRUCTURE DEVELOPMENT

The deployment of public charging infrastructure is outpacing the EV adoption rate in Europe. Nearly 1.14 million public charging points had been installed in Europe by the end of 2025, up from around 1.09 million at the end of the third quarter. For alternating current (AC) charging, this represents a 16% increase since the end of 2024. Direct current (DC) charging points showed even greater growth, increasing 35% since the end of 2024. Approximately 79% of Europe's public charging points supply AC, while the remaining 21% supply DC. Compared with 2024, Denmark recorded the largest growth in DC chargers by the end of 2025 (+55%), followed by Belgium (+52%) and Austria (+45%). At 37%, Denmark also saw the largest growth in AC chargers. While AC charging points vastly outnumbered DC charging points in nearly all countries, Norway had nearly equal shares of both (Table 11).

At the end of 2025, there were on average roughly 8.9 22 kW-equivalent publicly accessible charging points installed per thousand passenger cars and vans on the road in Europe, up from 8.2 at the end of September. With nearly 53 22 kW-equivalent publicly accessible charging points per thousand passenger cars and vans, Norway continues to lead Europe in charging infrastructure, followed by Iceland (47), Denmark (41), and Sweden (28). Italy (3) and Spain (3) fell below the European average for publicly accessible charging points.

Figure 5

22 kW-equivalent publicly accessible charging points installed per thousand passenger cars and vans, by type of power output and country by the end of 2025



Note: The width of the bars corresponds to passenger car and van stock size estimates as of the end of 2024. 22 kW-equivalent is used to account for different power outputs while allowing for comparison among countries.

THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION **THEICCT.ORG**

Table 11

Number of publicly accessible charging points installed by country and type of power output

Country	End of Q4 2025		Percentage change vs. end of Q4 2024	
	AC	DC	AC	DC
Netherlands	197,285	7,319	11%	21%
Germany	150,636	53,673	21%	39%
France	137,455	44,033	21%	34%

Norway	15,845	14,137	−16%	12%
Other	90,727	48,600	18%	44%
Total	**899,712**	**237,449**	**16%**	**35%**

DEFINITIONS, DATA SOURCES, METHODOLOGY, AND ASSUMPTIONS

- **Manufacturer pools:** Automakers are allowed to form pools to jointly comply with CO_2 targets. For this publication, the 2025 pools are defined according to the European Commission's "M1 pooling list" (cars) version from 23 December 2025 and the "N1 pooling list" (vans) version from 30 October 2025. The 2024 closed pools from the M1 pooling list have been carried over into 2025, even in the absence of a formal declaration in 2025, as they typically remain stable due to ongoing commercial affiliations (e.g., the Kia and Volkswagen pools). By contrast, we only included open pools that have been confirmed for 2025, because their composition tends to change more frequently than closed pools. Additionally, we assumed that the Renault Group formed closed passenger car and van pools in 2025 with its affiliated manufacturers and that the Mercedes-Benz Group formed a closed van pool with its affiliated manufacturers. For cars, the main brands are: BMW pool (BMW, Mini), Hyundai pool (Hyundai), Kia pool (Kia), Mercedes-Volvo-Polestar-Smart pool (Mercedes-Benz, Polestar, Smart, Volvo), Nissan-BYD pool (BYD, Nissan), Renault pool (Dacia, Renault), Tesla pool (Citroën, Fiat, Ford, Jeep, Mazda, Opel, Peugeot, Suzuki, Tesla, Toyota), and Volkswagen pool (Audi, Cupra, Porsche, SEAT, Škoda, VW). SAIC is a large passenger car manufacturer that is not part of a pool. Although the manufacturer Mazda Motor Europe is part of the Tesla pool, Mazda Logistics Europe and Changan Mazda have formed a separate pool. For this analysis, and due to data limitations, all Mazda registrations are allocated to the Tesla pool. In 2024, Mazda Logistics Europe accounted for 11% of total new Mazda registrations. Thus, the impact of the Mazda split on the Tesla pool is expected to be limited, with Mazda Logistics Europe representing an estimated < 1% of the pool's total registrations. For vans, the main brands are: Ford pool (Ford), Mercedes-Benz pool (Mercedes-Benz, Mitsubishi Fuso), Renault pool (Renault), Stellantis pool (Citroën, Fiat, Opel, Peugeot), Toyota pool (Toyota), and Volkswagen pool (MAN, Volkswagen). Iveco and Nissan are large van manufacturers not part of a pool.
- **Abbreviations: AC** = alternating current; **CO_2** = carbon dioxide; **DC** = direct current; **g/km** = grams per kilometer; **ZLEV** = zero- and low-emission vehicle.
- **Technical scope:** This publication focuses on new **passenger car and van** registrations. **Battery electric vehicles** (BEVs) are powered exclusively by an electric motor, with no additional source of propulsion. **Plug-in hybrid electric vehicles** (PHEVs) combine a conventional combustion engine with an electric propulsion system that can be recharged via an external power source. **Hybrid electric vehicles** here include full hybrid electric vehicles (HEVs) and mild hybrid electric vehicles (MHEVs). HEVs and MHEVs integrate two propulsion systems, usually a combustion engine and an electric propulsion system that cannot be recharged via an external power source. Key differences between HEVs and MHEVs are the system voltage and system power. HEVs can operate using only electric power for limited periods, while the electric propulsion system of MHEVs is typically only capable of assisting the combustion engine. For more on HEVs and MHEVs, see: Jan Dornoff et al., *Mild-Hybrid Vehicles: A Near Term Technology Trend for CO_2 Emissions Reduction* (International Council on Clean Transportation, 2022), https://theicct.org/publication/mild-hybrid-emissions-jul22/.
- **Geographic scope:** The European CO_2 regulation for vehicle manufacturers applies to all countries of the European Economic Area (EEA). This includes the 27 Member States of the European Union plus Iceland and Norway but excludes Liechtenstein. Data for new car and van registrations and shares of EVs in this publication cover all of these countries, with the exception of Liechtenstein and Malta. Data for CO_2 emission levels additionally omit Bulgaria, Hungary, Romania, and Slovenia. The 2025 cars and vans data for Bulgaria, Cyprus, and Portugal cover January to November 2025 only. For vans, 2025 data for Sweden also cover January to November only.
- **Data sources:** Dataforce (new vehicle registrations), Eco-Movement (charging points), and European Environment Agency (vehicle mass and eco-innovation credits). Historical values are regularly updated to reflect the latest data available.
- **Results may change over time:** Registrations and/or CO_2 data may be retrospectively updated by some of the national type-approval authorities. Similarly, charging infrastructure data may also be retrospectively updated by Eco-Movement.
- **Test procedures:** CO_2 values are provided according to the **Worldwide harmonized Light vehicles Test Procedure** (WLTP).

- **Flexible compliance mechanisms:** To facilitate meeting the CO_2 targets, manufacturers can make use of a number of compliance mechanisms, including (1) **eco-innovation technologies** and (2) **ZLEV factors**. First, manufacturers can reduce their CO_2 level by up to 6 g/km by deploying eco-innovation technologies. As a conservative estimate, we applied the 2024 level of eco-innovation CO_2 emission reductions per brand. For more on the methodology used, see: Uwe Tietge et al., *Overview and Evaluation of Eco-Innovations in European Passenger Car CO_2 Standards* (International Council on Clean Transportation, 2018), https://theicct.org/publications/eco-innovations-european-passenger-car-co2-standards. Second, if a manufacturer's ZLEV share exceeds 25% (for cars) or 17% (for vans), its CO_2 target is increased by the same number of percentage points, up to a maximum of 5%. This adjustment is referred to as the ZLEV factor, while the target before adjustment is called the manufacturer reference target. The manufacturer target is calculated by multiplying the reference target by the ZLEV factor. ZLEVs include BEVs and vehicles with CO_2 emissions of 50 g/km or less (WLTP). For details on the ZLEV factor mechanism, see: Jan Dornoff, *CO_2 Emission Standards for New Passenger Cars and Vans in the European Union* (International Council on Clean Transportation, 2023), https://theicct.org/publication/eu-co2-standards-cars-vans-may23/.
- **Mass-based targets:** For each manufacturer or manufacturer pool, a specific **2025 CO_2 target value** applies, depending on the average WLTP test mass of the new vehicles registered. For this publication, we assume the average WLTP test mass per manufacturer pool remains the same as in 2024. The average 2024 BEV and non-BEV test mass for each manufacturer was calculated based on data from the European Environment Agency and then weighted according to their year-to-date 2025 BEV market shares. For more on the methodology used, see: Uwe Tietge et al., *CO_2 Emissions from New Passenger Cars in Europe: Car Manufacturers' Performance in 2024* (International Council Clean Transportation, 2025), https://theicct.org/publication/co2-emissions-from-new-passenger-cars-in-europe-car-manufacturers-performance-in-2024-dec25/.
- **2025–2027 averaging**: Rather than an annual requirement to meet the CO_2 target applying from 2025 onward, manufacturers were granted the flexibility to comply based on their average CO_2 emissions over the 3-year period 2025–2027. This means that manufacturers may exceed their CO_2 targets in one or more years, provided that any excess emissions are balanced out by equivalent over-compliance in other years within the averaging period. For more details on the provision, see: International Council on Clean Transportation, *Public Comments on the European Commission Proposal to Introduce a 3-Year "Averaging" Provision for the CO_2 Standards Regulation for New Cars and Vans*, 2025, https://theicct.org/icct-comments-on-the-european-commission-proposal-to-introduce-a-3-year-averaging-provision-for-the-co2-standards-regulation-for-new-cars-and-vans/.
- **Charging point:** As defined in the Alternative Fuels Infrastructure Regulation, a charging point "means a fixed or mobile interface that allows for the transfer of electricity to an electric vehicle, which, whilst it may have one or several connectors to accommodate different connector types, is capable of recharging only one electric vehicle at a time, and excludes devices with a power output less than or equal to 3.7 kW, the primary purpose of which is not recharging electric vehicles."
- **Owner types:** This publication considers four types of owners: private cars, company fleets, short-term rentals, and car dealers and manufacturers. The private car category includes all registrations under private individuals, including those of self-employed persons, provided the vehicles are not registered under a company name. Private leasing is also included. Company fleets encompass all vehicles registered to companies, excluding those intended for resale or rental. This category includes company and public administration fleets, commercial long-term rentals, commercial leases, taxis, driving schools, diplomats, etc. The size of the fleet and the extent to which the vehicles are used privately are not considered relevant. The short-term rental type covers all registrations under large or small national and local rental companies. It also covers all vehicles flagged by authorities for self-drive rental purposes. The car dealers and manufacturers type includes all vehicles registered by car dealers and manufacturers. For automakers, this includes vehicles used for press purposes as well as those for their employees. New registrations data by owner type are aggregated for the following 19 European countries: Austria, Belgium, Czechia, Denmark, Finland, France, Germany, Iceland, Italy, Latvia, Lithuania, the Netherlands, Norway, Poland, Portugal, Spain, Sweden, Switzerland, and the United Kingdom.
